**Citation:** Yadav RC (2024) Mental Disorders Extended Ortism in Entertainment Celebrities: Some Exemplary Cases Fostering Innovative Antidotes. J Med Health Psychiatry 1: 1.

## Abstract

Gender development is a natural scientific creation discovered in the early 20th Century. Personality development is influenced by both internal and external factors, particularly evident in the challenges faced by women. Age and societal pressures can lead to transformations from glamour to destruction. External influences such as tabloids, music videos, gossip, and criticism have contributed to the rise of feminism, causing significant mental health issues in women. Many have succumbed to these pressures, becoming mentally unstable. This study highlights cases that showcase a shift from positive to negative outcomes, illustrating changes from a state of glamour to one of servitude. By managing the impulses of brain wave cycles, individuals can navigate these challenges and maintain control, a concept akin to the current physics topic of the God particle. While visible changes have occurred over time, they have not been revolutionary. However, this study has empowered individuals to confront perplexing situations, leading to a more favorable and sustainable environment in the entertainment industry.

**Keywords:** Popularity through madness; Celebrities in entertainment; Maintaining homeostasis; Simplifying complex ideas; Evolution of personality in adapting to circumstances; Transition from 1998 to 2013 and beyond; Developing resilience to overcome challenges

## Introduction

During the period from 1998 to 2013, tabloids, music videos, the press and gossip blogs served as vehicles that captivated the minds of many young girls who were drawn into the stream and forced to face significant devastations, irreparable over time. "Toxic: Women, fame, and tabloid of the 2000s" by Sarah Dittum recounted the stories of Britney Spears, Paris Hilton, Amine house, Janet Jackson, and other women seeking public recognition during that period, revealing how they lost all sense of boundaries [1]. The erosion of privacy left these women vulnerable to being mercilessly torn apart as if they were public property. In the wake of the "Me Too movement," these narratives took on a new perspective, prompting reflection on why so many female celebrities spiraled into self-destruction. What roles did scandals, sex tape scandals, and media gossips, fueled by male fascination, play in causing trauma and devastation to women? Various psychosocial insights have emerged to help understand past events and analyze current situations. The objective of this study was to deeply examine these circumstances and develop innovative psychological interventions to bring relief and prevent young girls from unwittingly falling into self-destructive situations.

## Materials and Methods

The study proceeded with systematic stepwise analyses to fulfill the legendary saying of looking back and thinking ahead. The past case-wise scenarios in the context of the study were reviewed, and

lessons were sought to apply them to new innovations. Different subsections were dedicated to achieving the set objectives.

### Horror wind of time period between, 1998-2013

The Reference highlighted the horrific situations where young girls joined the entertainment industry in hopes of becoming famous and wealthy [1]. The young girls, involved in tabloids, music videos, and gossip, were influential in attracting others to seek fast fame and popularity. The like-minded adolescent girls who joined and experienced the harsh realities of the industry, leading to their downfall, were included in the present study. Various internal and external factors contributed to ruining their careers, turning their experiences into a form of entertainment. These socio-economic deprivations within the industry will be presented in the results section of the study.

### External wind causing detractions

With the passage of time, the initial arrivals were becoming increasingly devastated, while new ones kept joining and enduring prolonged periods of horrifying winds. Throughout these times, there were numerous instances of humiliation and privacy violations. Women were treated as communal possessions and subjected to indecent treatments. These hardships were distressing experiences for

the newcomers, leading to further devastation. The extended duration of these challenges, referred to as the horror winds, was described by the sufferers themselves.

## Indogenic and exogenic factors

Genetic theory supports the development of human biology, involving endogenic factors that shape and refine one's ancestral features [2]. Additionally, there are exogenic factors that enhance and improve the expression of one's genomic characteristics. These interactive situations arise in unexpected ways and times for individuals, evolving with age. The mind, governed by neuro systems, is influenced by these factors. This aspect will be further explored in the results section of the study [3].

## Genetic theory and psychology

The scientific genetic theory of xx-xy (female and male) genders was discovered in the early years of the 20th Century (Singh, 2020) [2]. Further, refinements were brought by this author, which were of esteemed value [4-8]. It was established that any shock brings a lot of change in personality development, causing some disability in individuals [9]. Over time, as one grows, the disability fosters other parallel networks of subsystems exorbitantly, which had been a mystery until recent times. Many recent biological advances were made to address such personality development, termed as bad personality. Simultaneously, a new designer baby care for developing childcare from zero to hero was devised, which is termed as baby by choice and not by chance. Further advancements in terms of epigenetics were introduced, working as a software of the genomic features, recognized as a blueprint, for harnessing plausible expressions [3]. A neuro systems band was created, becoming the most recent advancement in personality development.

## Development for stabilizing one's mind

A composite key was developed to stabilize electrolyte disorders, which reduces the broad amplitude to remain within normal ranges.

This new approach is activated and its placement on the human body and global bio-systems is established by introducing new aspects that the human body consists of parallel networks of bio sub systems, receiving global acclaim.

## Collection of data

This study utilized various media reports emerging on past facts in the entertainment industry and well-known tragedies. Such data case studies raise broad awareness, making readers highly comprehensible. It is expected that readers will grasp the research being pursued here and reduce their skepticism in the appearance of names by seeing the citations in the reference and due acknowledgement [1].

## Data setting

Data sets were brought in comprehensible form enabling readers grasp relating subsequent developing scenarios in the present manuscript.

## Results

### The past scenarios of 1998-2013

Table 1 contains various cases that had occurred in the music and video industry, tabloids, and gossip columns [1]. These cases are included here for general review by the readers, not to cause any defamation or embarrassment towards the celebrities. By presenting these reports, readers can become aware of the facts and proceed confidently with the evolving developments in the current study. While the passage of one and a half decades' time may have brought about some changes, new talents in music and the audience continue to grow. For them, it always presents a new and exciting situation, contributing to the challenges faced by entertainment celebrities.

S.No	Name	Celebrity	Remarkable	Beynon innovative development		
				Developing mental situations	New stabilizing bifactor	Final outcome
Past scenario 1998-2013 and beyond						
1	Britney Spears	Teenaged	Culture conscious			
2	Paris Hamilton	Debutant	Privacy violation			
3	Lindsay Lohan	Young women	Grew up in public			
4	Emma Watson	Young women	Grew up in public			
5	Janet Jackson	Racism	Embarrassment			
6	Timberlake	Sexism	Embarrassment			
7	Jennifer Anniston	American	Married Brad Pritt			
8	Kim Kan Darmian	More savvy	About her sex tape			
9	Telli Ullah Williams	Self-declared	Autism			
Developing Ortis						
Mental stability will enable elderly celebrities have plausible long life.						

**Table 1:** Exemplary cases of crazy scenarios getting adversely transformed, self-ruining, and devastating.

Britney Spears, a teenage social conscious example of women looking sexy without valuing their pleasure, was deceived by her ex-sweetheart Justin Timberlake, who deflowered her on National TV, leading to deterioration in her mental state. She cut her hair and was kept in isolation by her father, who controlled her financial assets.

Even her bodyguard abandoned her in music and dance videos. These external factors damaged her personality, leaving her trapped in a cage by her father for 13 years. She was finally freed when her fans protested.

Paris Hilton, a debutante, had the insight that people didn't just want glamour from famous individuals; they also wanted to see them brought low. However, when her sex tape was leaked, she described it as electronic rape. Hilton attempted to sue, but the law provided no protection, and public legal action only increased interest. It was seen as a violation of privacy. Grotesque and comically distorted reactions were a common occurrence. Revenge porn had evolved into a full-blown genre on the internet.

This theater of cruelty was widely covered in the news cycle. Blogs like Gawker thrived on rumors, gossip, and unauthorized photos, inciting controversy. Young women who grew up in the public eye, such as Lindsay Lohan or Emma Watson, became the targets of sleazy attention.

The infamous Super bowl incident between Janet Jackson and Justin Timberlake, which immortalized wardrobe malfunctions, was dismissed as a publicity stunt, despite effectively ruining her career. Racism and sexism played a role, as acknowledged by Timberlake himself.

Female suffering became a form of entertainment. When America's sweetheart Jennifer Aniston married Brad Pitt, the marriage was as golden as expected. However, tabloids quickly tarnished everything, portraying her as a pitiful figure unable to overcome the new wave of "sad Janet, poor Janet." She became the unwilling object of scrutiny, much like every woman in Janet's family and Angelina Jolie's captivating chaos. But, was there an inquisitive sensation that some women knew what they were doing? To some extent, yes. For instance, Kim Kardashian displayed more awareness about her sex tape, turning embarrassment into an opportunity. They were partly victims, partly accomplices, much like everyone else, as per Simone de Beauvoir's perspective. The problematic relationship between women and the media has evolved. In 2013, women's consent started to be acknowledged, as seen when the music video

"Blurred Lines" was criticized for its questionable content. However, the entertainment industry and online platforms still pose risks for women. Nevertheless, conflicts and controversies in the year 2000 also shed light on the current situation.

## Summary of past scenarios exposing exogenic developing factors

All entries and detailed scenarios presented in the previous section (3.1) depicted facts from reference [1], with some enhancements for clarity. The phenomenon of young celebrities eager to achieve fame quickly was a natural occurrence due to their youth. Through in-depth case studies, crucial factors attracting many new comers over a period of one and a half decades, were identified, making everyone a fresh entrant. This summary aimed to help readers understand the facts and scenarios better facts.

Table 2 highlights significant new sociological factors that led to the downfall of celebrities. These factors include betrayal by relatives and close associates, the scandalous creation of sex tapes leading to public humiliation known as electronic violations, lack of legal protection, the public's voyeuristic attention, the objectification of women's poverty for entertainment, the downfall of wardrobe malfunction incidents, along with sexism, racism, and exploitation as socio-psychological factors. The exploitation of embarrassment as an opportunity, abusive relationships between women and the media, as well as scandals, tabloids, and disturbing music videos, acted as accelerating and fueling factors. These new sociological factors shed light on the external factors that caused celebrities to suffer greatly, with little control over the situation. These facts illustrated how young celebrities were ruined and devastated. While some celebrities were aware of this, the continuous influx of newcomers made the suffering seem like a natural process without any feedback, portraying the entire scenario as a way of life. There had been some changes, but significant improvement measures became necessary.

S.No	Celebrity	List of exogenic factors	Individual suffering depicted into composite effect	Overall adverse impact
1	2	3	4	5
1	Britney Spears	Own relatives and confidences	Deceiving of the entertainment Celebrity, no supporting law.	
2	Paris Hamilton	Providing glamour entertainment without caring her pleasant life	Sex tape spoiled image induced sensational electronically raped	
3	Lyndsay Lohan			
3	Emma Watson	Young celebrities grew in public	Gossip and abusive blogs and sleazy talks	
4	Janet and Timberlake	Wardrobe misery	Female misery Sad Jen, poor Jen, sexism and racial discrimination	
5	Jennifer with Brad Pitt	Celebrated Golden marriage	Tabloid spoiled her career	
6	Julie	Suffering brought by internet and media	Seductive image propaganda	
7	Kim Kardashian	Unfavorable median and environment	Embarrassment converted to opportunity	
8	Abusive relation with women and media			
8	Unbearable media environment		Suffocating environment for the Celebrities	
9	Snarls and pitiful blogs			
9	Unfavorable media environment		Indecent environment for the entertainment celebrities	
10	Talle Ullah	Severe mental disorder	Self-declared Ortis	
				Deceiving mistrust capturing wealth and exploiting of entertainment celebrities' lead to ruining and devastations. There came some transformations in situations, but needs building confidence and favorable environment

**Table 2:** Exogenous professional factors contributing to mental disorders in entertainers.

Figure 1 illustrates various exogenous factors affecting every celebrity, with significant negative consequences affecting them. These factors lead to mental disorders through the combined impact of uncontrollable elements. The severity of these effects can result in the development of autism in celebrities, leading to challenging mental health situations as documented in Table 1 and Table 2, as shown in Figure 1. Thus clear evidence introduced new scientific support for understanding the development of problematic scenarios among celebrities. Gender plays a crucial exogenous role in exacerbating issues for celebrities. The naturally induced erratic behavior further harms celebrities, who often lack legal protection.

**Figure 1:** Exogenic factors dragged producing mental disorder impact leading to Ortiz.

### The natural endogenic bio factor devastates and destroying the celebrities

The human body's complexity is crucial for maintaining ideal homeostasis, requiring a balance of various electrolytes. Good health necessitates micronutrients such as sodium, potassium, calcium, magnesium, chlorides, and phosphate. Various stresses can lead to imbalances in electrolytes, resulting in muscle pains, cramps, fatigue, uneasiness, swelling, digestive issues, vomiting, irregular heart function, sudden changes in blood pressure, and the onset of migraines and headaches. Therefore, it is essential to explore innovative, cost-effective measures to address these electrolyte imbalances. These disorders, caused by imbalanced electrolytes, can be attributed to both endogenous and exogenous factors, making the domain vast and unpredictable due to the involvement of numerous unforeseen circumstances that impact electrolyte levels.

### New bio factor linking wellness and mental situations

Many biological advances have enabled bringing gender-balanced families, resulting in parents and offspring experiencing improved mental well-being. The concept of choosing a designer baby rather than leaving it to chance represents an innovation. Exposure to different situations after birth has a significant impact on the development of children. While the genome is scientifically believed to determine personality traits, epigenetics - described as the software guiding the functioning of the hardware - get influenced by the mind. This scientific fact can alter the expression of genomic characteristics of any individual person.

### Personality building umbrella equipping ability to manage any unforeseen situation

There are external factors that lead to clouds of causing problems of concerns, resulting in perplexing situations. These include 1 unreasonable demand, 2 uncertainties, 3 unclear priorities, 4

unnecessary meetings, and last-minute panics, which occur in office workings. On these lines many parallel cloud forming situation can occur unexpectedly. Furthermore, personal body factors growth accentuated by overcoming a wide range of hypo and hyper situations that disrupt the balance of essential electrolytes such as sodium, potassium, calcium, magnesium, chlorides, and phosphorus. These ions are crucial for the functioning of interconnected sub-biological networks that facilitate production, consumption, and waste elimination. These advancements support and demonstrate potential improvements in challenging mental states, offering a way for celebrities to avoid future distresses.

**Figure 2:** New exogenic factors surrounding a cloud of worries broaden the amplitude of electrolyte disorders. It enables one to create their own umbrella for defined goals.

### New Epigenetic to charter function of genome of individuals to improve expression

This author created an active band that mitigates electrolytic disorders resulting from internal and external factors (Figure 3). This mental equilibrium promotes good health and a sound mind, enhancing individuals' management abilities for any unforeseen adverse situation. The proceeding discussion on research and development led to the creation of a comprehensive summary figure enriched with insights.

**Figure 3:** New band of bringing global health security

## Manoeuvre of miscreant, absurd bloggers, snarls and antisocial activists

Earlier studies by the author explored biological factors and their ranges, revealing the severity of criminal behavior [10-14]. A method was developed to determine the range and nature of criminal acts, allowing for the appropriate severity of punishments. The initial discussions highlighted the extensive social harm caused, affecting celebrities in the entertainment industry. Many of their own relatives and close associates engaged in misconduct, leading to their downfall. Over time, attitudes became more lenient, creating an opportunity to caution individuals against such behaviors and highly unpleasant actions that were once normalized. There were numerous cases where celebrities found themselves in difficult situations but chose to take a positive approach, overlooking the wrong doings. It may be beneficial to introduce awards recognizing different levels of social decency for male offenders. The manuscript also introduces some social reform measures in the subsequent sections. The award will infuse some sense of pride in doing decent actions and showing decency towards the celebreties.

## Other sociological improvements for overcoming critique bloggers and snarls becoming agent for ruining and devastations of entertainment celebrities

There had been numerous cases of mental disorders leading individuals to commit various crimes. Another sociological approach suggests that such individuals should be encouraged to participate in traditional Indian marriage ceremonies, where multiple rituals are conducted in a specific sequence. Both the bride and groom receive lessons on reform in the presence of their families and friends, which act as evidences for of taking pledge doing all time pleasant and decent behavior and actions. The newly married couples abandon their rigidity and embrace flexible attitudes. These marriages prevent individuals from engaging in severe crimes, and various social sanctions are imposed with detailed justifications. The presentation introduces highly relevant, effective, feasible, and adaptable social improvement measures. Through these measures, Indian marriage ceremonies help smooth out differences and instill resilience. Both the brides and grooms make commitments during various temperamental ceremonies. This sociological approach aims to reduce the prevalence of common-law relationships, which often lead to mental health issues in many developed countries. Such practices have been implemented in India's renowned tihar jail, where inmates are permitted to marry and can live with their partners. The bloggers, Tabloid operators and functionaries remain in decency towards the entertainment celebrities. This will save the helpless celebrities acquire eternal strength and save themselves from bad situations.

A website is launched inviting both men and women to participate. This website offers step-by-step assistance for all necessary functions. Marriage enhances lifestyle through a strong and understanding partnership. In most cases, individuals with mental disorders experience an improvement in their mental health after getting married. If any mental health issues arise, the partner can provide support, ensuring a continuous lifeline, much like two parallel railway lines forming railway track supporting speeding trains. This serves as a convincing example of improvement in mental

disorders. It is suggested that couples in cohabiting relationships, especially those facing developmental disorders, consider transitioning to traditional Indian-style marriages. Such cases will experience positive changes and achieve a better lifestyle compared to their current situation.

## Discussion

The present study discussed the enthusiasm, profitable circumstances and the situation where entertainment celebrities came together after the Me-too movement, which led to their reputation being tarnished and damaged. The study highlighted the biological factors that played a crucial role in these challenging situations. Various innovative corrective measures were introduced. This discussion focused on validating the emerging findings, enhancements, and potential future improvements.

## Using entertainment celebrities cases of past period 1998-2013

The development of the obsession with quickly becoming famous in the entertainment industry was a natural instinct for young girls. Those in the entertainment sector utilized tabloids, music videos, blogs, and social media platforms, which led to an increase in concerns that had adverse effects on the mental health of celebrities. As time passed, many individuals found themselves in distressing situations, facing ruin and devastation. Over a period of almost a quarter of a century, various age groups were negatively impacted and suffered. Despite being aware of the challenges, many celebrities attempted to navigate through them. There was a lack of legal support, and misconduct was often normalized. The vulnerabilities of celebrities were often disregarded and accepted as part of their lifestyle. The study identified around 10 biosocial factors that played a crucial role in tarnishing lives and leading to ruin and devastation. In many cases, their own family members and close associates exploited them, contributing to mental health disorders.

There might be skepticism about the names mentioned in the study. A report based on such names had already been featured in print media [1]. The prominent cases had suffered from sensational news that caused tremendous embarrassments. Their image was tarnished, affecting their mental health. Therefore, skeptics should have acknowledged these facts seriously, but instead, they took it lightly and considered it as a way of life. Hence, this research was conducted with the awareness of not sparking any controversy but rather to allow readers to assess with confidence. The reference cited the customary practice with fairness and attention to not bring defamation to the celebrities mentioned by name.

## Derivation of crucial factors cussing celebrities joining and spoiling

The biological factors manifested as betrayal by relatives and close associates, with everyone enjoying the entertainment of music and dance by famous celebrities. The humiliation led to severe mental disorders. The leaked sex video tarnished the image of celebrities, who termed it electronic rape. There were discriminations in tabloids, abusive relationships between women and the media, discrimination, and embarrassment. Wardrobe malfunctions and racial and sexist

discrimination. Tabloids ruined an American celebrity and damaged her career. Some celebrities saw embarrassment as an opportunity, but ultimately, she also failed in her attempt. There was an abusive relationship between women and the media. Consent was misconstrued as communication, bloggers and critics played significant role in exacerbating the mental health issues of celebrities. There have been some improvements in horror and entertainment industries, but there is still no safe space for women. The law offered no assistance, and taking legal action was seen as fueling negative opinions. The accusations continued, and celebrities' suffering resurfaced periodically. This situation motivated researchers to find ways to alleviate mental anguish, aiming to introduce an antidote to the situation.

## Developing scenario got dragged by the exogenic factor prevailing then

The exogenic factors highlighted in subsection 4.2 arose due to the prevailing horror wind that the subjects could not escape, being drawn into it by the emerging natural frenzy. The suffering individuals found themselves helpless in such situations. Over time, as age advanced, celebrities endured various uncontrolled factors. In this wind, individuals suffered, and isolated celebrities experienced severe mental disorders, revealing limitations in their personalities. These exogenic factors resulted from the undue freedom taken by troublemakers in creating tabloids, music videos, and inappropriate attention. The celebrities endured this horror wind for more than 25 years, with no one daring to intervene due to the public crowd of spectators. The observers themselves developed mental disorders from witnessing strong acts of violence and becoming fanatical. Around 8, law enforcement agencies took a lenient approach, considering it a way of life. Although time has passed, it cannot be claimed that the entire undesirable situation had been resolved. This indicates a transformation in exogenic factors, but it still requires careful attention and the enforcement of strict law and order.

## Mental disorders and new scientific advancement

Earlier studies by the author explored various factors, including urine pH levels. When the pH levels exceeded 8, it led to severe consequences in mental stability of any individual. In instances involving celebrities, their pH levels remained low, leading to their downfall attitudes. In male-dominated situations, all the blame was placed on the celebrities. The unfavorable environment contributed to the suffering of the celebrities. Over time, the studies highlighted prevalent scenarios, prompting the consideration of remedial actions for current and potential victims. The results section of the study introduced innovative measures. This aspect is further discussed in the following section.

## Epigenetic composite key for controlling widened amplitude

It was established that electrolytic disorders with broadened amplitudes cause a lot of health issues. These disorders affect the neuro system, which serves as the epigenetics for functioning as the software of the Genome in cell biology of individuals. Epigenetics is influenced by the mind. Therefore, any innovative measure that enhances the functions of epigenetics will improve the individual's

ability to manage situations. This study introduced a composite button to regulate the electrolytes and maintain the homeostasis of human health (Figure 3). All electrolytic disorders caused by external or internal factors will be alleviated by the composite button. As a result, the electrolytes will have the inherent capacity to handle unforeseen situations under all circumstances. Individuals will maintain normal mental states and avoid developing autism.

## Manoeuvre of miscreants and snarls who exploited situation for their amusements

The study revealed that the entertainment industry is predominantly male dominated, with external factors contributing to a harmful environment that celebrities could not overcome with their achievements. Even the law failed to provide assistance. With time already passed, the only option left is to learn from the situation and work towards a better future. It was suggested that amidst the chaos caused by wrongdoers, it would be beneficial to establish awards to honor individuals who perform good deeds. This was not implemented, and this example will serve as a beacon of hope in a sea of misdeeds. Implementing other measures from past events could also have a positive impact.

## New social reformations for improving lifestyles of both males and female genders who got spoiled and remained in difficult lifestyles

This social factor improvement is a new genetic measure to address problems across generations and lifestyles. The example mentioned in the results section is highly convincing for adopting this innovative approach. Some may be skeptical that this is already in practice, but the present study provides scientific support and gene-based solutions. Hence, it will be the most ideal improvement in the entertainment industry scenarios. Celebrities will be protected from any unfavorable situations. It is expected that these measures will create a more decent environment and prevent any retaliatory actions.

## Utility of wisdom derived from the present study for safe guarding the futures

The past experience provides an opportunity to highlight the positive aspects of previous celebrities and create virtual presentations for business purposes, such as weddings, that will serve as corrective measures. This will uphold the respectable achievements of entertainment celebrities. During these events, exemplary cases should be cited for the awardees. This will have a positive impact on creating a respectable environment and fulfilling the function of the entertainment industry.

The study considered the latest advancements in human biology as stated by the Indian Medical Association, highlighting the absence of medical technology to safeguard female children, whether before or after birth. The chairman suggested determining post-conception to protect female embryos, ensuring the well-being of girls after birth. The author has contributed significantly to renowned medical journals on human biology [3-7,10], showcasing notable progress in various aspects. Additionally, the authors demonstrated the usefulness of genomic resources [11]. By drawing inspiration from a book they developed new natural materials to address electrolytic

disorders and proposed simple measures to maintain homeostasis [12-17].

## Strength, Weakness, Opportunity and Threat (SWOT) analysis

The study is strongly supported by scientific theories, making it very robust. It is devoid of weakness and offers significant opportunities for enhancing decency and business prospects. There are no threats of any kind associated with it, giving it a unique status in its approach and effectiveness, providing excellent solutions in sociology. The recent advancements will help in addressing the increasing number of mental disorders, reaching 13,14 cases. The research supports the progress in overcoming mental disorders. [15-17].

## Conclusion

During the last decade of the 20th Century until 2013, the Entertainment Industry faced challenges that brought tragedy to Celebrities. Deep case studies revealed scenarios ruining celebrities and causing their devastations. Social genetic factors, including exogenic and endogenic factors, were identified as causes of electrolytic disorders leading to over 45 health hazards. Various sociological factors were established, and innovative antidotes were developed to effectively address these issues. These measures significantly contributed to creating mental stability, transforming the style of music and video production, and introducing famous virtual characters, ultimately leading to the flourishing of the entertainment industry with adequate care and respect for celebrities.
